Hawking Radiation

- Stephen Hawking first studied the effects of Quantum Fields in Schwarzschild spacetime, and discovered that black hole (of mass M say) emits thermal radiations¹ with a temperature $T_{BH} = \frac{1}{8\pi M}$.
- The origin of these radiations were accounted for by considering vacuum fluctuations near the event horizon and tunneling of one of the virtual particles through the horizon, while letting the other particle to escape as radiation.

¹S.W. Hawking, Comm. Math. Phys. 43(1975) 199 

Hawking Radiation

- Stephen Hawking first studied the effects of Quantum Fields in Schwarzschild spacetime, and discovered that black hole (of mass M say) emits thermal radiations¹ with a temperature $T_{BH} = \frac{1}{8\pi M}$.
- The origin of these radiations were accounted for by considering vacuum fluctuations near the event horizon and tunneling of one of the virtual particles through the horizon, while letting the other particle to escape as radiation.
- However, the original calculations by Hawking and later by others, based on Bogoliubov transformation, has no direct connection with tunneling phenomenon.

¹S.W. Hawking, Comm. Math. Phys. 43(1975) 199

Hawking Radiation as Tunneling

Conclusion

Non-thermal Hawking radiation "preserves" unitarity

- As Parikh⁶ pointed out, the non-thermal radiation spectrum is consistent with unitary evolution.
- The tunneling rate for non-thermal radiation is given by,

$$\Gamma \sim \exp\left(-8\pi E\left(M - \frac{E}{2}\right)\right) \quad (2)$$

$$= \exp(\Delta S_{BH}) \quad (3)$$

⁶M.K. Parikh, "Energy Conservation and Hawking Radiation",
arXiv:hep-th/0402166

Non-thermal Hawking radiation "preserves" unitarity

- As Parikh⁶ pointed out, the non-thermal radiation spectrum is consistent with unitary evolution.
- The tunneling rate for non-thermal radiation is given by,

$$\Gamma \sim \exp\left(-8\pi E\left(M - \frac{E}{2}\right)\right) \quad (2)$$

$$= \exp(\Delta S_{BH}) \quad (3)$$

- In Quantum Mechanics, the rate of a unitary process is $\Gamma(i \rightarrow f) = |M_{fi}|^2$. (*phase space factor*)
where, M_{fi} is the amplitude for the process

⁶M.K. Parikh, "Energy Conservation and Hawking Radiation",
arXiv:hep-th/0402166

Non-thermal Hawking radiation "preserves" unitarity

- The phase space factor is obtained by summing over all possible final states (exponent of the final entropy) and averaging over all possible initial states (exponent of the initial entropy).

Pratik Ghosal

Introduction

Earlier Works

Results

Calculating number of microstates

Calculating Branching Ratio

Conclusion

Non-thermal Hawking radiation "preserves" unitarity

- The phase space factor is obtained by summing over all possible final states (exponent of the final entropy) and averaging over all possible initial states (exponent of the initial entropy).
- Therefore, the rate is

$$\Gamma \sim \frac{e^{S_{final}}}{e^{S_{initial}}} = \exp(\Delta S_{BH})$$

Pratik Ghosal

Introduction

Earlier Works

Results

Calculating number of microstates

Calculating Branching Ratio

Conclusion

Non-thermal Hawking radiation "preserves" unitarity

- The phase space factor is obtained by summing over all possible final states (exponent of the final entropy) and averaging over all possible initial states (exponent of the initial entropy).
- Therefore, the rate is

$$\Gamma \sim \frac{e^{S_{final}}}{e^{S_{initial}}} = \exp(\Delta S_{BH})$$

- These non-thermal radiations carries hidden correlations shared between them and the entropy of the final system of radiations (after complete evaporation of black hole) is euqual to the initial Black hole entropy⁷.

Conclusion

Counting "number of microstates" of the complete Hawking radiation

- After that a second particle with energy E_2 is emitted from a BH of mass $M - E_1$, with probability

$$\Gamma(E_2|E_1) = e^{-8\pi E_2(M - E_1 - \frac{E_2}{2})}$$

and completely evaporates the BH ($E_1 + E_2 = M$).

- Total probability for the occurrence of these event is

$$\begin{aligned} P(E_1, E_2) &= \Gamma(E_1)\Gamma(E_2|E_1) \\ &= e^{-4\pi M^2} \end{aligned} \tag{4}$$

Pratik Ghosal

Introduction

Earlier Works

Results

Calculating number of microstates

Calculating Branching Ratio

Conclusion

Counting "number of microstates" of the complete Hawking radiation

- After that a second particle with energy E_2 is emitted from a BH of mass $M - E_1$, with probability

$$\Gamma(E_2|E_1) = e^{-8\pi E_2(M - E_1 - \frac{E_2}{2})}$$

and completely evaporates the BH ($E_1 + E_2 = M$).

- Total probability for the occurrence of these event is

$$\begin{aligned} P(E_1, E_2) &= \Gamma(E_1)\Gamma(E_2|E_1) \\ &= e^{-4\pi M^2} \end{aligned} \tag{4}$$

- Now, if a particle of energy E_2 is emitted first, then followed by a particle of energy E_1 , then total probability for the event would be

$$P(E_2, E_1) = \Gamma(E_2)\Gamma(E_1|E_2) = e^{-4\pi M^2}$$

Pratik Ghosal

Introduction

Earlier Works

Results

Calculating number of microstates

Calculating Branching Ratio

Conclusion

Counting "number of microstates" of the complete Hawking radiation

- This is true in general for any number of particles, irrespective of their sequence of emission.

i.e,

$$\begin{aligned} P(E_1, \dots, E_n) &= \Gamma(E_1)\Gamma(E_2|E_1)\Gamma(E_3|E_1, E_2)\dots\Gamma(E_n|E_1, \dots, E_{n-1}) \\ &= e^{-4\pi M^2} \end{aligned} \quad (5)$$

Pratik Ghosal

Introduction

Earlier Works

Results

Calculating number of
microstates

Calculating Branching
Ratio

Conclusion

Counting "number of microstates" of the complete Hawking radiation

- This is true in general for any number of particles, irrespective of their sequence of emission.

i.e,

$$\begin{aligned} P(E_1, \dots, E_n) &= \Gamma(E_1)\Gamma(E_2|E_1)\Gamma(E_3|E_1, E_2)\dots\Gamma(E_n|E_1, \dots, E_{n-1}) \\ &= e^{-4\pi M^2} \end{aligned} \quad (5)$$

- Thus we have a system of n particles, with total energy $\sum_{i=1}^n E_i = M$. This system can exist in several microstates, as denoted by the sequence of emission.

$(E_1, E_2, E_3, \dots, E_n)$

$(E_2, E_1, E_3, \dots, E_n)$

$(E_7, E_n, E_3, \dots, E_2)$ etc.

Pratik Ghosal

Introduction

Earlier Works

Results

Calculating number of microstates

Calculating Branching Ratio

Conclusion

Counting "number of microstates" of the complete Hawking radiation

- All these microstates are equally probable with probability $P = e^{-4\pi M^2}$. Since, all microstates are equally probable, number of microstates is given by,

$$\Omega = \frac{1}{P} = e^{4\pi M^2} \quad (6)$$

and the entropy of the system is given by,

$$S_{rad} = \ln \Omega = 4\pi M^2 = S_{BH} \quad (7)$$

Pratik Ghosal

Introduction

Earlier Works

Results

Calculating number of
microstatesCalculating Branching
